Computer Vision Model

Pending

The current Computer Vision Model does not know about this taxon, so while it might be included in automated suggestions with the "Nearby" label, it will not have the "Visually Similar" label. While the requirements for model inclusion change with each model, generally inclusion is based on number of observations, so to increase the chance of this taxon getting included during the next model training, add or identify more observations of this taxon.

About Interactions

Most organisms interact with other organisms in some way or another, and how they do so usually defines how they fit into an ecosystem. These interactions come to us from [Global Biotic Interactions \(GLOBI\)](#), a database and webservice that combines interaction data from numerous sources, including iNaturalist. You can actually contribute to this database by adding the "Eating", "Eaten by", and "Host" observation fields to observations that demonstrate those interactions.

About Names

Most categories of organisms have "common names" in spoken languages. These names are usually recognizable, easy to pronounce, and stable over time, but many organisms have several different names in different places, even in the same language, which can make it difficult to communicate about these organisms without confusion. Scientists address this problem by using a single "scienti...

About Establishment Means

"Establishment means" describes how a species arrived where it currently occurs. Introduced means it arrived because of human activity, while native means it arrived without human assistance. Endemic species only occur in a specific place and nowhere else. [More](#)
