Between January 1st and December 31st, 2012, 48 newly diagnosed HIV cases were reported to the Maine CDC. Demographic data provided in the table below show that men who have sex with other men are disproportionately affected by HIV in Maine. While most diagnoses were seen in the 40-49 year age range, new diagnoses were reported in people 3-75 years of age. Of the 48 newly reported HIV cases, nine (9) of those also received an AIDS diagnosis within 1 month of testing positive for HIV. There were a total of 15 AIDS cases diagnosed in Maine in 2012. Current records indicate that 1,654[†] of Maine's residents are infected with HIV. The table below presents demographic data for newly diagnosed and prevalent HIV cases in Maine.

Includes living AIDS cases and confidential HIV cases reported to the Maine CDC through 12/31/2012.

¹ Includes partners who are MSM, IDU, or partners who are infected with HIV or have AIDS.

[†] Maine CDC estimates that HIV/AIDS reporting is 95% complete. 1,741 Mainers may therefore be living with diagnosed HIV/AIDS in 2012 (an estimated 87 individuals with an HIV diagnosis remain unreported).
